

Assignment 1: Introduction to Systems Programming

Kevin Rich, Francis Vo, Soo-Hyun Yoo

October 15, 2012

1 Mathematical Analysis

1.1 Algorithm 1

Data: Integer array A of size N

Result: Greatest Sum of Subarray

```
1 for i ← 0 to N do
2   for j ← i to N do
3     s ← 0
4     for k ← i to j do
5       s ← s + A[k]
6     end
7     if s > max then
8       max ← s
9     end
10  end
11 end
```

Algorithm 1: Pseudocode for Basic Enumeration

This Algorithm has 3 for-loops so it is $O(n^3)$.

1.2 Algorithm 2

Data: Integer array A of size N

Result: Greatest Sum of Subarray

```
1 for i ← 0 to N do
2   s ← 0
3   for j ← i to N do
4     s ← A[j]
5     if s > max then
6       max ← s
7     end
8   end
9 end
```

Algorithm 2: Pseudocode for Better Enumeration

This Algorithm has 2 for-loops so it is $O(n^2)$.

1.3 Algorithm 3

Data: Integer array A of size N

Result: Greatest Sum of Subarray

```
1 sums ← MaxSubarray_rec (A)
2 return max (sums)
```

Algorithm 3: Pseudocode for Divide and Conquer - Starting function

Data: Integer array A of size N

Result: Integer array of size 4

```
1 if A.size ≤ 1 then
2   | sums.all ← A [0]
3   | sums.left ← A [0]
4   | sums.right ← A [0]
5   | sums.overall ← A [0]
6 end
7 left_sums ← MaxSubarray_rec (A.left_branch)
8 right_sums ← MaxSubarray_rec (A.right_branch)
9 sums.all = left_sums.all + right_sums.all
10 sums.left = max (left_sums.left, left_sums.all + right_sums.left)
11 sums.right = max (right_sums.right, left_sums.right + right_sums.all)
12 m = left_sums.right + right_sums.left
13 sums.overall = max (sums.all, sums.left, sums.right, m)
14 return sums
```

Algorithm 4: Pseudocode for Divide and Conquer - Recursive function

This algorithm is recurvsive and decreases by half every step. Each lower step has double the ammount of calls. This algorithm is $O(n\log(n))$

2 Theoretical Correctness

3 Testing

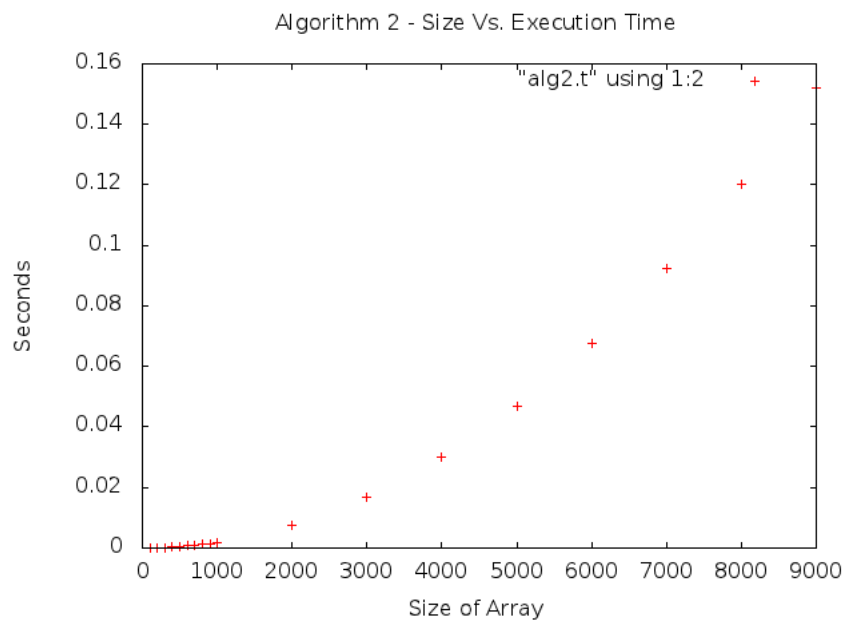

Student ID	Answer
931678074	5703
930569466	8184
932086449	4949

4 Experimental Analysis

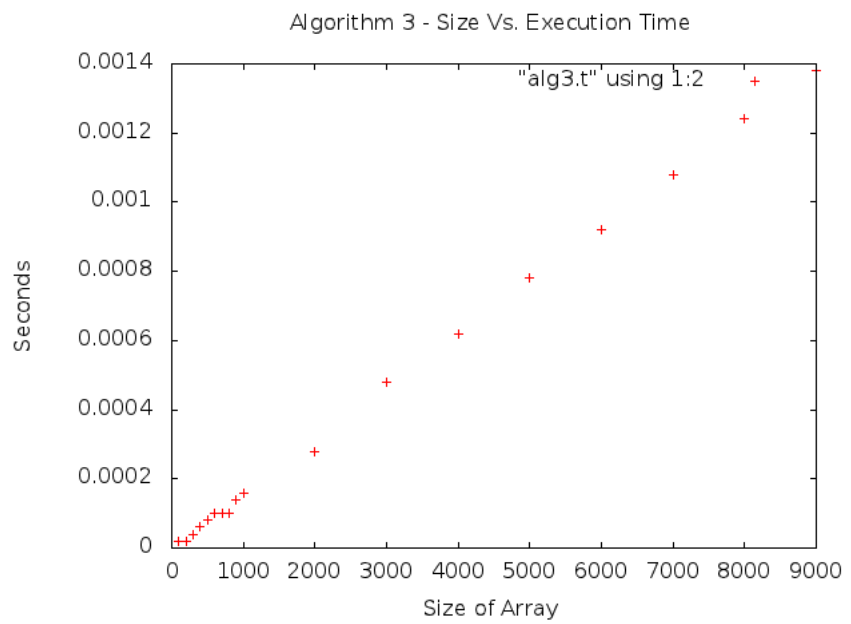

4.1 Algorithm 1

4.2 Algorithm 2

4.3 Algorithm 3

5 Extrapolation and Interpretation

5.1 Extrapolation

The functions were calculated using gnuplot's fit function.

5.2 Interpretation

The functions were calculated using gnuplot's fit function and fitting the data to $f(n) = 10^{m \cdot \log_{10}(n) + c}$. The slopes for each algorithm is a little lower than the actual power because of the creation overhead of the function has a larger affect on arrays with small sizes. This will cause the left side higher and therefore decreases slope.

5.3 Algorithm 1

5.3.1 Extrapolation

$$f(n) = 4.71599 \times 10^{-10} \times n^3$$
$$f(n) = 3600 \rightarrow n = 19690$$

5.3.2 Interpretation

$$\text{Slope} = 2.99734$$

5.4 Algorithm 2

5.4.1 Extrapolation

$$f(n) = 1.87761 \times 10^{-9} \times n^2$$
$$f(n) = 3600 \rightarrow n = 1384678$$

5.4.2 Interpretation

$$\text{Slope} = 1.99602$$

5.5 Algorithm 3

5.5.1 Extrapolation

$$f(n) = 1.74832 \times 10^{-8} \times n \times \log(n)$$
$$f(n) = 3600 \rightarrow n = 8984428998 = 8.98 \times 10^9$$

5.5.2 Interpretation

$$\text{Slope} = 1.00506$$

6 Code

6.1 Files

alg1.cpp - function for algorithm 1

alg2.cpp - function for algorithm 1

alg3.cpp - function for algorithm 1

analysis.cpp - code to run algorithm and measure times for the number of array then outputs .t file

makefile - to compile files

maxSubarray.pdf -

maxSubarray.tex - to create pdf filename

test.cpp - allows input of file, and runs algorithm on input file

analysis/ - hold compiled executables for running analysis

test/ - hold compiled executables for running tests on code, and test array files

timingfiles/ - holds files for creating plots

timingfiles/*.t - files that holds run times for different array sizes

timingfiles/*.gp - code for gnuplot. 2 plots of each algorithm: 1 normal plot, and 1 log-log plot

6.2 Algorithm 1

```
1  /*
2  * Enumeration
3  * Loop over each pair of indices i; j and compute the sum from k=i to j of a[k].
4  * Keep the best sum you have found so far.
5  */
6
7  using namespace std;
8
9
10 int MaxSubarray(int a[], int n){
11
12     int i, j, k;
13     int max = a[0];
14     int sum;
15     for (i = 0; i < n; ++i) {
16         for (j = i; j < n; ++j) {
17             sum = 0;
18             for (k = i; k <= j; ++k) {
19                 sum += a[k];
20             }
21             if (max < sum) {
22                 max = sum;
23             }
24         }
25     }
26     return max;
27 }
```

alg1.cpp

6.3 Algorithm 2

```
1  /*
2  * Better Enumeration
3  * Notice that in the previous algorithm, the same sum is computed many times.
4  * In particular, notice that sum from k=i to j of a[k] can be computed from sum from k=
5  * i to j - 1 of a[k] in O(1) time, rather than starting from scratch.
6  * Write a new version of the first algorithm that takes advantage of this observation.
7  */
8
9  using namespace std;
10
11
12  int MaxSubarray(int a[], int n){
13
14      int i, j, k;
15      int max = a[0];
16      int sum;
17      for (i = 0; i < n; ++i) {
18          sum = 0;
19          for (j = i; j < n; ++j) {
20              sum += a[j];
21              if (max < sum) {
22                  max = sum;
23              }
24          }
25      }
26      return max;
27  }
```

alg2.cpp

6.4 Algorithm 3

```
1  /*
2  * Divide and Conquer
3  * If we split the array into two halves, we know that the maximum subarray will either
4  *   be
5  *   * contained entirely in the first half,
6  *   * contained entirely in the second half, or
7  *   * made of a suffix of the first half of maximum sum and a prefix of the second
8  *     half of maximum sum
9  * The first two cases can be found recursively. The last case can be found in linear
10 * time.
11 */
